

There is a solution to having straighter teeth without having to wear metal braces. Known as invisible orthodontics, this type of treatment offers you the choice of wearing a clear and sometimes removable appliance while straightening and aligning your teeth.

Step 1
- Consultation

Come in for a free consultation to meet our Invisalign Doctors and see whether Invisalign would be the right course of treatment for you.

Step 2
- Record

Once you have decided to proceed with treatment, our doctors will take x-rays, photos and a 3D scan of your teeth. These will be sent electronically to Invisalign to compile your 3D simulation, called a ClinCheck.

Step 3
- ClinCheck

See your teeth on screen and see the simulated movement with your Invisalign Aligners. Once both Dentist and patient are happy with the result we send the ClinCheck off for manufacturing

Step 4
- Fitting and Treatment

Once the aligners have arrived you will follow your personalised treatment plan and continue your journey to straight teeth.

Step 5
- Maintain

Once your teeth have been moved into position, we need to keep them there. Retention is the most important stage so you can maintain that perfect Invisalign smile, always.

BENEFITS OF INVISALIGN

- Healthier Gums
- Virtually Invisible
- Removable
- Easier Cleaning
- Decreased risk of abnormal wear

**Invisalign from
£28 per month**

IPR

IPR stands for Interproximal Reduction. While this procedure is used with all types of orthodontics, it is a noteworthy part of Invisalign treatment to repair crowded teeth and create space.

Attachments

Invisalign is a revolutionary orthodontic option, but sometimes, certain movements can be difficult for the aligners to accomplish. An attachment can help ensure the right forces are placed in the right places to move the teeth. The attachments allow the aligner to "grip" or "grab" a tooth for ease of movement.
